## Расчетное задание по математической статистике

- 1. По числовой выборке объема 50 из нормальной совокупности с параметрами  $\alpha$  и  $\sigma^2$  (первая выборка) построить доверительные интервалы уровня доверия  $1 \varepsilon$  для параметра:
  - а)  $\alpha$ , если  $\sigma^2$  известно, б)  $\alpha$ , если  $\sigma^2$  неизвестно,
  - в)  $\sigma^2$ , если  $\alpha$  известно,  $\Gamma$ )  $\sigma^2$ , если  $\alpha$  неизвестно.
- **2.** По данным числовым наблюдениям (вторая выборка объема 30) проверить основную гипотезу о равномерности распределения с помощью
  - а) критерия Колмогорова,
  - б) критерия хи-квадрат (асимптотического размера  $\varepsilon$ ).
  - В обоих пунктах найти реально достигнутые уровни значимости. Построить график эмпирической функции распределения.
- **3.** По данным двум выборкам из нормальных совокупностей (первые 20 и следующие 30 элементов первой выборки) проверить, с помощью критериев размера  $\varepsilon$ , гипотезу
  - а) о совпадении дисперсий при неизвестных средних,
  - б) о совпадении средних, если известно, что неизвестные дисперсии совпадают.
